

Format

Message

Options:

- Delimiter

e.g. " - ". It divides the different parts of the logger message, e.g. "myMethod() - my message - return value = a"

The delimiter is important when performing "Re-apply"!

The delimiter is used in the templates section (Log4E (Templates))

- Delimiter within message

e.g. " : ". It separates the different parts within a `{message}` and is used when invoking "Insert Log Statements At This Position..."

It should be different to the Delimiter above.

The delimiter is used in the templates section (Log4E (Templates)).

Example:`logger.debug("myMethod() - my message : int i = " + i);`

- Return value description

e.g. "return value". It is used when logger message includes the return value of the enclosing method.

- Open parenthesis after methodname

You can leave that preference alone. "(" should be the right setting.

Example:`logger.debug("myMethod(String) - start");`

- Close parenthesis after methodname

You can leave that preference alone. ")" should be the right setting.

Example:`logger.debug("myMethod(String) - start");`

- Equals symbol (`{enclosing_method_arguments}`)

Delimiter between variable name and value. And delimiter between "Return value description" and return value. Default: '='

Example:`logger.debug("myMethod(String str=" + str + ") - end - return value=" + returnInt);`
