

# Logger Declaration

Two operations are executed:

- import statements
- declare logger

Most of the documentation is already done in the Preferences

Example: `import org.apache.log4j.Logger;`

```
public class MyClass {  
    /**  
     * Logger for this class  
     */  
    private static final Logger logger = Logger.getLogger(MyClass.class);  
}
```
